

Meta Business & E-commerce Tracking Setup

Portfolio Case Study • WooCommerce Fashion E-commerce

BUSINESS FOUNDATION

Meta Business Portfolio
Facebook + Instagram
Existing Ad Account

TRACKING

Dataset / Meta Pixel
Conversions API
Website event verification

E-COMMERCE

WooCommerce connection
Product Catalog
Product synchronization

PROJECT OUTCOME

A structured Meta setup was completed for a WooCommerce clothing store, connecting business assets, advertising infrastructure, product data and website tracking. Key e-commerce events were tested to prepare the store for conversion-focused Meta advertising.

ROLE / HANDS-ON WORK

Business setup • Asset connection • Dataset / Pixel • WooCommerce integration • Catalog • Event testing

01 — PROJECT SNAPSHOT

The project focused on building the Meta business and measurement foundation for Saaniya Designs, a clothing e-commerce brand using WooCommerce.

PROJECT	Saaniya Designs — Meta Business & E-commerce Tracking Setup
PLATFORM	WooCommerce
MARKET	United Arab Emirates
META ASSETS	Business Portfolio • Facebook Page • Instagram • Existing Ad Account
MEASUREMENT	Dataset / Meta Pixel • Conversions API • Events Manager
COMMERCE	Saaniya Designs Catalogue • WooCommerce product synchronization

OBJECTIVES

- 1 Create and organize the Meta Business Portfolio.
- 2 Connect the Facebook Page and Instagram account.
- 3 Add the existing Meta Ad Account rather than creating a duplicate.
- 4 Create the Saaniya Designs Dataset / Pixel.
- 5 Install and configure the official Meta for WooCommerce integration.
- 6 Create and connect the WooCommerce product catalog.
- 7 Enable browser-side and server-side website event delivery.
- 8 Test PageView, ViewContent, ViewCategory and AddToCart.

02 — FINAL SETUP ARCHITECTURE

How the completed Meta + WooCommerce ecosystem was organized.

THE FLOW

Recruiter takeaway: This was not only an ad-account setup. The work connected the business identity, advertising account, website tracking, server-side event delivery and e-commerce product data into one working ecosystem.

03 — IMPLEMENTATION WORKFLOW

The actual setup sequence completed for the store.

1	Created Meta Business Portfolio	Created the "Saaniya Designs" Business Portfolio to organize the brand's Meta assets.
2	Connected Facebook Page	Connected the Saaniya Designs Facebook Page for organic content and advertising.
3	Connected Instagram	Connected @saaniya.designs so Facebook and Instagram assets could be managed together.
4	Added existing Ad Account	Used the existing Meta Ad Account instead of creating a duplicate.
5	Created Dataset / Pixel	Created "Saaniya Designs Pixel" in Events Manager / Data Sources for website measurement.
6	Installed Meta for WooCommerce	Installed and activated the official Meta for WooCommerce plugin instead of manually adding Pixel code.
7	Connected WooCommerce	Completed WooCommerce onboarding and connected the store to the Meta environment; market set to UAE.
8	Created Product Catalog	Created "Saaniya Designs Catalogue" for WooCommerce product synchronization and Meta commerce/advertising.
9	Verified Website Tracking	Observed PageView, ViewContent and ViewCategory, then tested AddToCart through the WooCommerce cart.
10	Verified Conversions API	Confirmed server-side event delivery through Conversions API via the WooCommerce integration.

04 — META PIXEL & E-COMMERCE EVENTS

The Dataset / Pixel was created for website event measurement. The setup was then tested against real WooCommerce browsing and cart activity.

EVENT	WHAT IT REPRESENTS	WHY IT MATTERS
PageView	Visitor opens a website page	Measures website visits
ViewContent	Visitor opens a product	Measures product interest
ViewCategory	Visitor opens a category	Measures category browsing
AddToCart	Visitor adds a kurti/product to cart	Measures purchase intent
InitiateCheckout	Visitor starts checkout	Measures checkout intent
Purchase	Customer completes an order	Measures conversions / revenue

WHAT WAS ACTUALLY VERIFIED

✓ PageView

✓ ViewContent

✓ ViewCategory

✓ AddToCart

Why this matters for advertising

The verified events create the measurement foundation needed to understand website activity and support conversion-focused Meta advertising. The setup distinguishes website event tracking from the source that originally brought the visitor to the site.

05 — PIXEL VS. CONVERSIONS API

The project used two complementary ways of sending website event information to Meta.

METHOD	SOURCE	EXAMPLE
Meta Pixel / Browser	Visitor's browser	Browser reports a product view to Meta
Conversions API / Server	WooCommerce website server	Server sends AddToCart or Purchase to Meta
Multiple	Browser + Server	Both sources contribute; Meta can deduplicate the event

Important distinction

Pixel and Conversions API are tracking methods, not traffic sources. A visitor may arrive from an Instagram ad, Instagram bio, Facebook, Google, WhatsApp, email or a direct visit. The traffic source and the event delivery method are separate concepts.

06 — WOOCOMMERCE + PRODUCT CATALOG

The WooCommerce connection handled the bridge between the online store and Meta's commerce environment.

01	Official integration Installed and activated Meta for WooCommerce instead of manually adding Pixel code.
02	Store connection Completed WooCommerce onboarding and connected the store to the Saaniya Designs Meta environment.
03	Market Configured the market as United Arab Emirates.
04	Catalog Created and connected “Saaniya Designs Catalogue” for product synchronization and Meta commerce/advertising.

Why the catalog matters

The catalog gives Meta a structured product dataset for commerce and advertising, while WooCommerce remains the store platform where the products and actual orders live.

07 — TESTING, VERIFICATION & REPORTING

The setup was checked end-to-end before considering the store ready for conversion-focused advertising.

✓	Business Portfolio active
✓	Facebook and Instagram assets connected
✓	Existing Ad Account added
✓	Saaniya Designs Pixel / Dataset created
✓	Meta for WooCommerce installed and activated
✓	Saaniya Designs Catalogue created / connected
✓	Website appeared as a connected data source
✓	PageView, ViewContent and ViewCategory observed
✓	AddToCart tested through the WooCommerce cart
✓	Conversions API server-side delivery confirmed

TOOLS & THEIR ROLES

Events Manager	Check received website events and diagnose tracking.
Ads Manager	Analyze campaigns, conversions, cost per result, purchases and ROAS.
WooCommerce	Source of truth for actual store orders and customer order records.
Google Analytics	Broader traffic-source and website behavior analysis.

08 — SEO FOUNDATION

Google Site Kit was connected to Search Console, Analytics and PageSpeed Insights so SEO work can be measured. This section records the foundation only: SEO optimisation has not started, and no ranking or traffic results are claimed.

PLUGIN	Google Site Kit (WordPress)
SEARCH CONSOLE	Connected to https://saaniyadesigns.com/
ANALYTICS	Connected through Site Kit
PAGESPEED	PageSpeed Insights connected for speed checks
SEO PLUGIN	Installed; optimisation not started yet
BRAND SEARCH	The site is indexed. A brand-name search (Oct 2026) shows an AI Overview describing the store. This is a brand search, not a ranking result.

STATUS: CONNECTED, OPTIMISATION NOT STARTED

The tools are active and collecting data. The planned steps below turn this foundation into measurable SEO work.

PLANNED FIRST STEPS

- 1 Submit the sitemap in Search Console and check page indexing.
- 2 Record a 28-day baseline of clicks and impressions.
- 3 Write a proper homepage title and meta description.
- 4 Improve titles and descriptions for the top product and category pages.
- 5 Fix the main mobile issues reported by PageSpeed Insights.
- 6 Re-check the same numbers after four weeks.

09 — PROJECT OUTCOME

Meta Business & E-commerce Tracking Setup — Saaniya Designs

Successfully configured the Meta business and e-commerce tracking ecosystem for Saaniya Designs, including the Business Portfolio, Facebook and Instagram assets, existing Ad Account, Dataset / Pixel, WooCommerce integration, Product Catalog, Conversions API and website event tracking.

Key events including **PageView**, **ViewContent**, **ViewCategory** and **AddToCart** were tested and verified, preparing the store for conversion-focused Meta advertising.

SKILLS DEMONSTRATED

✓	Meta Business Portfolio setup
✓	Meta Ads Manager setup
✓	Meta Events Manager
✓	Meta Pixel / Dataset setup
✓	Conversions API fundamentals
✓	WooCommerce–Meta integration
✓	Commerce Catalog setup and product synchronization
✓	Website event tracking and testing
✓	Conversion tracking and attribution fundamentals

PROJECT	Meta Business & E-commerce Tracking Setup
PLATFORM	WooCommerce
TRACKING	Meta Pixel + Conversions API
EVENTS VERIFIED	PageView • ViewContent • ViewCategory • AddToCart

SEO foundation: Google Site Kit is connected to Search Console, Analytics and PageSpeed Insights (section 08).
SEO optimisation and Meta ads are planned and have not started.

WOOCOMMERCE PAYMENT CONFIGURATION

Saaniya Designs • E-commerce implementation case study

PROJECT OBJECTIVE

Review WooCommerce payment settings and document the setup path for accepting online payments in a UAE-based clothing store, while keeping offline checkout options in view.

01 • SETTINGS REVIEWED

WordPress Admin → WooCommerce → Settings → Payments

02 • OPTIONS IDENTIFIED

WooPayments setup, PayPal and offline payment methods

03 • GATEWAYS CONSIDERED

PayTabs, Telr and Stripe as provider options to evaluate

04 • CHECKOUT OPTIONS

Cash on Delivery and Direct Bank Transfer

WORK COMPLETED

01

Reviewed WooCommerce payment settings

Opened the Payments tab and reviewed the methods and setup prompts available in the store dashboard.

02

Compared integration routes

Considered an available WooCommerce integration or a provider's official plugin, depending on provider support.

03

Mapped activation requirements

Identified merchant onboarding, business verification, bank details and provider credentials as likely requirements.

04

Documented checkout processing

Outlined how payment status returns to WooCommerce and how eligible funds are paid out by the provider.

HOW A PAYMENT FLOWS

From customer checkout to WooCommerce order status and provider payout

1	CUSTOMER CHECKOUT	Customer selects an available payment method on the checkout page.
2	PAYMENT PROCESSING	The selected provider processes the transaction, subject to its own checks.
3	STATUS RETURNED	The provider sends a payment result back to WooCommerce.
4	ORDER UPDATED	WooCommerce updates the order status according to the received payment result.
5	PAYOUT	The provider pays eligible funds to the linked bank account according to its payout schedule and fees.

CURRENT STATUS

OPTIONS REVIEWED ACTIVATION NOT CONFIRMED	A live gateway connection, bank verification, successful test transaction and payout have not been confirmed. This section records the setup review and preparation work; it does not claim that online payments are active.
--	--

NEXT STEPS

01	Confirm provider eligibility for the business location and required currencies.
02	Choose a provider based on supported payment methods, fees and payout timing.
03	Complete the provider's onboarding and business verification.
04	Connect the official WooCommerce integration and enter provider credentials.
05	Run a test checkout and verify that WooCommerce receives the correct order status.
06	Confirm payout details before announcing online payment availability.

TOOLS & OPTIONS REVIEWED

WooCommerce Settings → Payments • WooPayments • PayPal • PayTabs • Telr • Stripe • Cash on Delivery • Direct Bank Transfer

PROJECT SUMMARY

Reviewed WooCommerce payment settings, evaluated possible integration routes, mapped the checkout-to-payout workflow and identified the activation and testing steps required before live payment acceptance.
